

Enterprise RAG — Evaluation Suite

Step 1: Review ground truth → Step 2: Run live pipeline → Step 3: Score with RAGAS

Step 1 — Ground Truth Step 2 — Live Pipeline Step 3 — Eval Metrics

Eval Metrics — RAGAS + Tool Correctness

Runs all 6 metric experiments on the stored responses. LLM-based metrics use `JUDGE_OPENAI_API_KEY` — samples are scored one at a time with 40s cooldowns between samples as a conservative rate-limit buffer. Total runtime: ~50 min.

Token key used: `JUDGE_OPENAI_API_KEY` (separate from production key). Each sample is processed individually to stay within OpenAI rate limits.

Run Eval Metrics

All 6 experiments complete!

Exp 1 — Faithfulness — AVG: 0.59 Fair

question	faithfulness
Which kubectl commands confirm that the Metrics Server is collect	
What Databricks CLI command retrieves the details of a specific j	
When should you use the Databricks REST API instead of the CLI or	
What are the three main developer tools for managing Databricks j	
What are the valid restart policy values for a Kubernetes Job pod	
What are the completions and parallelism fields in a Kubernetes J	
Which Kubernetes API group does a Job resource belong to?	
How do you start a local Kubernetes cluster using Minikube?	
What kubectl command checks the status of a running Kubernetes Jo	
How do you verify that the core Kubernetes components are running	

Exp 2 — Answer Relevancy — AVG: 0.78 Good

question	answer_relevancy
Which kubectl commands confirm that the Metrics Server is collect
