

Enterprise RAG — Evaluation Suite

Step 1: Review ground truth → Step 2: Run live pipeline → Step 3: Score with RAGAS

📄 Step 1 — Ground Truth

🔧 Step 2 — Live Pipeline

📊 Step 3 — Eval Metrics

Eval Metrics — RAGAS + Tool Correctness

Runs all 6 metric experiments on the stored responses. LLM-based metrics use `JUDGE_GROQ` key — samples are scored one at a time with 40s cooldowns between samples to stay within Groq's 6,000 TPM on-demand limit. Total runtime: ~50 min.

📘

Token key used: `JUDGE_GROQ` (separate from production key). Each sample is processed individually (~2,800 tokens/burst) to avoid the 6,000 TPM ceiling.

▶ Run Eval Metrics

✅ All 6 experiments complete!

Exp 1 — Faithfulness — AVG:

🔴 0.13

 ❌ Poor

question	faithfulness
How do you start Redis for a Kubernetes work queue?	
What does the parallelism field do in the Kubernetes job-wq-2 man	
How do you fill the Redis work queue with tasks using the CLI?	
What is the difference between HPA and VPA in Kubernetes?	
How do you install the Metrics Server for Kubernetes pod autoscal	
Which kubectl commands confirm that the Metrics Server is collect	
What Databricks CLI command retrieves the details of a specific j	
When should you use the Databricks REST API instead of the CLI or	
What are the three main developer tools for managing Databricks j	
What are the valid restart policy values for a Kubernetes Job pod	

Exp 2 — Answer Relevancy — AVG:

🟢 0.91

 ✅ Good
